INTRODUCTION

- AI Fit Track API is designed to collect and process fitness-related data.
- It can support activity tracking, fitness analysis and personalized recommendations.
- The API acts as a bridge between a fitness application and its backend services.

PROBLEM STATEMENT

- Fitness data is often stored across different applications and devices.
- Users may find it difficult to understand their daily activity and progress.
- A centralized API can organize fitness data and provide meaningful insights.

PROPOSED SOLUTION

- Collect fitness data through API requests.
- Store and process user activity information.
- Analyze fitness metrics using intelligent logic.
- Provide personalized progress information and recommendations.

KEY FEATURES

- User profile & fitness data management
- Activity and workout tracking
- Fitness metrics analysis
- Progress monitoring
- Personalized recommendations
- Secure API-based communication

TECHNOLOGY & WORKFLOW

- Frontend / Mobile App → AI Fit Track API → Backend Server → Database
- API: REST / JSON
- Backend: Node.js / Express (prototype)
- Database: MongoDB
- AI/Analytics: fitness-data analysis and recommendation logic

EXPECTED OUTCOMES

- Centralized and structured fitness information
- Easy integration with fitness applications
- Useful activity and progress insights
- Personalized fitness support
- Scalable foundation for future AI-based health features
